

## GitLogFusion

Related Categories: ColdFusion

I had some code I tossed on GitHub, lamely named **GitLogFusion**. It provides web-based statistics on a Git repository, using ColdFusion.

The code includes an example, and offers:

- Author List from the Git repo.
- Commit counts, by author. A date range is optional.
- A range/author filtered listing of the git log. This can be provided in text or xml format.
- Related file changes, by commit id.
- Optional regex linking of commit msgs to issue tracking.

It requires cfexecute to be enabled, git installed on the machine running the code, and a local path to the repository.

I'd appreciate, if someone is bored, a code review. I've been in a rut lately, and need to improve. Feel free to tell me how dumb I am, and what should be done better. I won't hate you for too long!
